À the R1 interface through which the EGRP update was learned. The metric varies depending on which Level 3 protocol is routed. Per Favore. Selección 2 Respuestas correctas The interface fa0 / 1 A configured with IPv6 2001 address: DB8: ACAD: TO : 12. Provides segmentation at Level 2. A router first installs paths with greater administrative distances. Because the A@ PC1 connects to an Ethernet network, an Ethernet header is used. Resumen Cisco CCNA 2 Simulation V6.0 Test Chapter 1 Questions and Answers CCNA 2 Chapter 1 Questions and Answers of the quiz. Send the packet out the GigabitEthernet0 / 0 interface. Please Select 3 Respuestas correctas A host can't use its IP address and subnet mask to determine if a destination A on the same network or on a remote network. The administrative distance refers to the incident particular route. If the destination network number is different, the packet is sent to the default gateway (the router sending the packet forward to the target network). The loopback A interface is a logical interface inside the router and is automatically placed in an up state, as long as the router functions. When a match is found, the packet is sent to the interface associated with the network number. If there is no last resort gateway, the UPS package has fallen. Cisco Express (CEF) A forwarding is the fastest and most preferred switching method. Send the packet out the GigabitEthernet0 / 1 interface. Please select 2 Respuestas correctas the result of and any IP addresses with a subnet mask A network number. R1 leaves the field blank and forwards the data to the PC. To provide a path to forward packets for which there is no route in the routing table to forward all packets to the device with IP address 209.165.200.226 For a dynamic path for the destination network 0.0.0.0 to the routing table to forward packets for network 0.0.0.0 to the device with address 209.165.200.226 The ip route 0.0.0.0 0.0.0.0 command adds a default route to a router routing table. A the interface on R1 used to send data that A is intended for 10.1.1.0/24. Por favor, selects 2 response correctas The value of the administrative distance cannot be changed by administrator. A static path configured on a router can be distributed by the router to other neighboring routers. A router contains four types of memory: RAM A volatile memory A used to store running IOSs, running configuration files, routing table, ARP table, so as to serve as a ROM packet buffer. A nonvolatile memory A used to hold a limited version of IOS, startup instructions, and basic NVRAM diagnostic software A nonvolatile memory A startup configuration files Flash memory A nonvolatile memory A used to hold IOS and other system files a path received via the OSPF routing protocol a path received via the OSPF routing protocol The most credible route or the lowest administrative distance route the one directly connected to a router. A directly linked network is added to the routing table when the following three conditions are met: (1) A interface configured with a valid IP address; (2) A activated without any power-off command; and (3) receives a carrier signal from another device connected to interface. The subnet mask is not correct for IPv4. To see descriptions, the interface and speed settings and duplex, use the show running-config interface command. A metric is calculated from a routing protocol and is used to determine the best path (minimum metric value) to a remote network, this simulation, take your test, get your score and share with others!
